Multi–Serial Port option now available in GB\DataTransfer

Feature allows Mazak users to connect multiple machines to one PC and eliminate manual switchboxes

CORVALLIS, Oregon – Griffo Brothers Inc., the world leader in offline programming solutions for Mazatrol, has enhanced its GB\DataTransfer[TM] program with a multi–serial port option. GB\DataTransfer allows users to upload and download Mazatrol, EIA and ISO files from their Mazak machines, as well as track inventory, manage program files and associate text and graphics to specific data files, all at their PC.

The multi–port option allows users to take advantage of multi–port serial device features, including cards and serial hubs, when available. The GB\DataTransfer software supports a range of multi–port devices from various manufacturers, provided they support RS232–C communications.

With the multi–port feature, GB\DataTransfer users can:

- ♦ Assign each machine tool to a separate serial port
- ♦ Access each serial port using an easy pull–down menu in GB\DataTransfer
- ♦ Customize each serial port to a baud rate specific to its assigned machine tool
- ♦ Streamline work areas and manufacturing cells by eliminating multiple manual switchboxes
- ♦ Plan for future expansion by having extra serial ports readily available

The multi–port feature is a special option that CamLink users must request when ordering GB\DataTransfer. Current CamLink for Windows users can upgrade their system to this option for a nominal fee.

The multi–port option in GB\DataTransfer provides reliable data transmission and helps Mazak users increase shop efficiency.
